UNIVERSAL AND POWERFUL.

A scanner that meets even the highest of standards.

Being able to meet the highest of standards, and to do so dependably and tirelessly, day in, day out – this is precisely what you can expect of and what you get from the new XINO scanning systems from microform GmbH. XINO stands for „maximum innovation“ and is reflected in the new XINO S700 product series. The tiered model range concept comprises three versions, the top-of-the-range model boasting a scanning speed of up to 200 ppm. The XINO S700 is equipped with an integral patchcode sorter that enables patchcode sheets to be sorted out of the stack automatically in real time while scanning is in process. This allows you to reuse these sheets and make considerable cost savings. In addition, the integrated Smart Color Detection function is capable of detecting color-coded markers, which means there is no need for additional patchcode sheets in the first place – batches with color marked documents are separated automatically.

To guarantee uniform illumination of documents, the system is kitted out with LEDs that are ready for action straight away (no warmup phase) and boast a high level of constancy and a very long life span. This eliminates any follow-up costs for replacement lamps. The tried-and-tested, unique paper transport system of microform scanners has been further optimized for the XINO S700. The feeder is equipped with individually controllable, three-sensor, ultrasonic double-sheet detection and variable settings for the batch height.

The XINO S700 stands out thanks to its great versatility and robustness. It's a genuine 24/7 workaholic that handles practically every type of document you can throw at it. The XINOCapture scanning software included with it features a comprehensive portfolio of functions, such as scan job design, image processing, the execution of event rules, and barcode processing, and can also be upgraded to different levels.
